Hold Baggage Screening (HBS) Solutions refer to systems and technologies designed to inspect and screen checked baggage in airports. The purpose of HBS is to detect and identify any potentially dangerous or prohibited items within checked luggage that could pose a threat to the safety and security of the aircraft, passengers, and airport personnel.

Key features and components of Hold Baggage Screening Solutions typically include:

Baggage Handling System (BHS):

The BHS is the integrated system responsible for the automated movement of checked baggage throughout the airport, including check-in, sorting, screening, and transportation to the aircraft.

Baggage Screening Machines:

These machines are used to scan and inspect checked bags for explosives, weapons, or other prohibited items. There are various types of baggage screening machines.

Automated Threat Detection Software:

Advanced software analyzes the X-ray images generated by the screening machines to automatically flag potential threats or suspicious items for further inspection by security personnel.

Alarm Resolution Area (ARA):

Designated spaces for manual inspection and resolution of alarms triggered by the automated screening process. Trained security personnel physically inspect flagged items to confirm or rule out threats.

The deployment of efficient Hold Baggage Screening Solutions is crucial for maintaining airport security, complying with regulatory requirements, and ensuring the safety of passengers and cargo during air travel. These systems have evolved to incorporate advanced technologies and adhere to international standards to enhance detection capabilities and improve overall aviation security.
