## Abstracts

According to our (Global Info Research) latest study, the global Hollow Fiber Bioreactors market size was valued at USD 1853.1 million in 2023 and is forecast to a readjusted size of USD 2895.7 million by 2030 with a CAGR of 6.6% during review period.

A Hollow fiber bioreactor is a 3 dimensional cell culturing system based on hollow fibers, which are small, semi-permeable capillary membranes arranged in parallel array with a typical molecular weight cut-off (MWCO) range of 10-30 kDa. These hollow fiber membranes are often bundled and housed within tubular polycarbonate shells to create hollow fiber bioreactor cartridges. Within the cartridges, which are also fitted with inlet and outlet ports, are two compartments: the intracapillary (IC) space within the hollow fibers, and the extracapillary (EC) space surrounding the hollow fibers.

The fact that hollow fiber bioreactors are very small and yet enable incredibly high cell densities has led to their development for both research and commercial applications, including monoclonal antibody and influenza vaccine production.

The Global Info Research report includes an overview of the development of the Hollow Fiber Bioreactors industry chain, the market status of Monoclonal Antibodies (Cellulosic, Polypropylene), Recombinant Proteins (Cellulosic, Polypropylene), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Hollow Fiber Bioreactors.
