Membrane oxygenator, also known as membrane artificial lung, is a disposable artificial device that can exchange blood and gas. According to the principle of alveolar gas exchange, it integrates the functions of oxygenation, temperature change, blood storage and filtration. It is used to replace the lung function for blood oxygen and remove carbon dioxide to meet the needs of patients during operation. It is characterized by no direct contact between qi and blood, and good bionics. At present, hollow fiber membrane oxygenator is a kind of oxygenator that is closest to human physiological condition.
