According to our (Global Info Research) latest study, the global Hollow Photonic Crystal Fiber market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Hollow photonic crystal fiber is a special fiber structure with a hollow core region composed of periodic pore structures. The characteristic of this type of optical fiber is that it does not contain substantial photoconductive materials in the core area, but rather achieves light transmission through periodically arranged air channels. The main characteristics and advantages of hollow photonic crystal fibers are as follows: low optical loss: due to the lack of substantial materials in the core region, light transmission in hollow photonic crystal fibers hardly undergoes absorption and scattering, thus achieving low optical loss transmission. Large mode area: The core area of the hollow photonic crystal fiber is hollow, allowing the beam to propagate over a large area. This is very beneficial for transmitting high-power light and achieving low nonlinear effects. Good beam quality: The design of hollow photonic crystal fibers can achieve quasi single mode transmission, thereby maintaining high beam focus and good beam quality. High non-linear effect: Due to the interaction between light and substances in the air, mid space photonic crystal fibers can have high non-linear coefficients and are suitable for applications such as frequency conversion of light, ultrafast light modulation, and optical clock. Low dispersion characteristics: The dispersion characteristics of mid space photonic crystal fibers can be designed and optimized by adjusting the pore structure to achieve the required dispersion characteristics, such as zero dispersion, positive dispersion, or negative dispersion. Hollow photonic crystal fibers have wide applications in fields such as laser science, optical transmission, spectral analysis, fiber

sensing, and optical communication. They can be used for laser beam transmission, high-power lasers, supercontinuum spectrum generation, gas sensing, fiber lasers, and other applications to meet the needs of different fields.
