Holographic non-destructive testing is a method that utilizes holographic imaging technology for object detection and evaluation. It achieves non-destructive testing of objects by recording holographic images of the object and using the principles of interference and diffraction to analyze the object's surface topography, internal structure, or material properties. This technique is usually used in engineering, material science, medicine and other fields to detect defects, diseases, material properties and so on. Holographic non-destructive testing is characterized by high sensitivity, high resolution and non-contact, and is suitable for the inspection needs of various materials and objects.
