The global Holographic Notch Filters (HNFs) market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Holographic Notch Filters (HNFs) are state-of-the-art volume holograms that provide high laser attenuation in a very narrow bandwidth. They are ideal for laser spectroscopy. In Raman applications, Stokes and anti-Stokes data can be collected with tens of laser line wavenumbers. HNFs are made by recording an interference pattern created by a laser beam in a layer of dichromated gelatin between two sheets of flat glass. They have a number of advantages over dielectric interference filters made by vacuum depositing multiple thin discrete layers with different refractive indices. First, HNF provides narrow bandwidth attenuation without cutting useful spectral parts near the laser line. Second, they do not produce the secondary reflection bands found in dielectric interference filters
