Home Compostable Film is a biodegradable material designed to break down naturally in a home composting environment, typically within 6 to 12 months, without the need for industrial composting facilities. These films are made from renewable resources, such as plant-based polymers like PLA (polylactic acid), PHA (polyhydroxyalkanoates), or cellulose, and are formulated to decompose at lower temperatures commonly found in home composts (20-30°C). The degradation process results in non-toxic byproducts, such as water, carbon dioxide, and organic matter, which enrich the compost without leaving harmful residues. Certified by standards like T?V Austria's OK Compost Home, these films are environmentally friendly alternatives to traditional plastics, ideal for packaging and agricultural applications where end-of-life compostability is crucial.
