## Abstracts

According to our (Global Info Research) latest study, the global Homogeneous Membrane Electrodialyzer market size was valued at US\$ 123 million in 2025 and is forecast to a readjusted size of US\$ 209 million by 2032 with a CAGR of 8.0% during review period.

As various industries have higher and higher requirements for the quality and energy consumption of products and materials, the superiority of homogeneous membrane electro dialysis is becoming more and more obvious. The feed liquid treated by homogeneous membrane electro dialysis can better meet the requirements of customers. It has the characteristics of low membrane surface resistance, high current efficiency, low energy consumption, good selective permeability and high yield. The homogeneous membrane electro dialysis equipment is a series of structural units composed of a certain number of membranes, each of which is divided into a dialysis chamber and a diffusion chamber by a cationic homogeneous membrane, and countercurrent operation is adopted. When the waste alkali liquid and the receiving liquid are introduced into the two sides of the cationic homogeneous membrane respectively, the concentration of alkali and its salt on the waste alkali liquid side is much higher than that on the water side. Homogeneous membrane electro dialysis can realize the desalination of brackish water or seawater, salt concentration, desalination and refining of organic solutions, etc.

The homogeneous membrane electro dialyzer uses an advanced homogeneous ion exchange membrane that has higher permselectivity and lower resistance, thereby improving the efficiency and performance of the electro dialysis process. With the continuous advancement of membrane manufacturing technology, the performance of

homogeneous membranes has been significantly improved, and its stability and durability have also been enhanced, allowing homogeneous membrane electrolysers to exhibit excellent performance in various application scenarios. performance.

Homogeneous membrane electrolysers have been widely used in seawater desalination, brackish water desalination, drinking water production and other fields. In addition, in the chemical, food, pharmaceutical, biological, metallurgical, environmental protection and other industries, homogeneous membrane electrolysers also play an important role and are used for desalination of materials, treatment of wastewater, and resource utilization of waste salt. Especially in the new energy lithium battery industry, homogeneous membrane electrolysers are used for the extraction and recovery of lithium ions, providing strong support for the development of the new energy industry.

With the continuous development of electrolysis technology and the continuous expansion of application fields, the market size of homogeneous membrane electrolysers is also continuing to expand. Globally, more and more companies and research institutions have begun to pay attention to the research and development of homogeneous membrane electrolysers, promoting the rapid development of this technology.
