A horizontal draw bench is a type of machinery used primarily in metalworking and materials processing. Here's an overview of its key features and applications:

Overview

Function: The horizontal draw bench is designed to pull materials, typically metal rods, wires, or tubes, through a die to reduce their diameter and increase their length. This process is known as drawing.

Design: The machine consists of a horizontal frame with a pulling mechanism, which usually includes a motor, and a die setup where the material is shaped. The die determines the final dimensions of the drawn material.

Operation: The material is fed into the draw bench, where it is clamped and then pulled through the die by the motorized mechanism. This process can be controlled for speed and tension, allowing for precise shaping and dimensioning.
