## Abstracts

According to our (Global Info Research) latest study, the global Hormone Herbicide market size was valued at US\$ 628 million in 2024 and is forecast to a readjusted size of USD 987 million by 2031 with a CAGR of 6.6% during review period.

Hormone herbicides are a type of selective herbicide that simulates the mechanism of action of natural auxins (such as indoleacetic acid) in plants, interferes with the normal growth regulation process of plants, causes abnormal cell division, tissue deformity, physiological disorders, and ultimately causes weed death. This type of herbicide is mainly used to control broadleaf weeds and is relatively safe for gramineous crops (such as wheat and corn). Common representatives include 2,4-D and MCPA, which are widely used in agriculture, horticulture and non-arable land weed control.
