Abstracts

HAP is a type of pneumonia that is caused after 48 hours of hospitalization. HAP is one of the major challenges faced by the public healthcare system today. The disease is the second most common type of hospital-acquired infections. Pneumonia is an inflammatory condition of lungs and mainly affects the microscopic air sacs called alveoli. This is primarily caused by infection by bacteria or viruses and sometimes with other microorganisms. It can be mainly distinguished on how the infection was acquired.

Scope of the Report:

This report focuses on the Hospital-Acquired Pneumonia (HAP) Drugs in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

One trend in the market is combination therapy for the treatment of HAP. Monotherapy is the common treatment given for nosocomial pneumonia. However, combination therapy has sometimes been found to be more appropriate and desirable treatment. One driver in the market is unmet demand due to lack of available treatment for MDR microorganisms. Lack of proper treatment options available for the treatment of HAP because of MDR microorganisms is a major challenge for the healthcare providers. MDR microorganisms are those microorganisms that have developed antimicrobial drugs resistance. The resistance among various microorganisms to various antimicrobial drugs has emerged as a serious threat to public health across the globe. The worldwide market for Hospital-Acquired Pneumonia (HAP) Drugs is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research)
