## Abstracts

Host cell proteins essentially refers to the heterogeneous group of proteins that are derived from host cells such as yeast, E-coli, and mammal, among others. They differ largely from each other in terms of properties, isoelectric point, and molecular mass. Identification and quantification of host cell contaminants is very important in the development of biopharmaceuticals.

Scope of the Report:

A range of techniques are used for identification of host cell contaminants, for instance, immuno-specific techniques such as ELISA, Western Blot, PCR, and non-specific techniques such as electrophoresis and LC-MS. In general, semi-quantitative or quantitative methods are used for sample purification. However, during the biopharmaceutical development, an ideal method is required to identify all kinds of host cell contaminants with high throughput, and quantitative analysis.

The global Host Cell Contaminant Testing market is valued at xx million USD in 2017 and is expected to reach xx million USD by the end of 2023, growing at a CAGR of xx% between 2017 and 2023.

The Asia-Pacific will occupy for more market share in following years, especially in China, also fast growing India and Southeast Asia regions.

North America, especially The United States, will still play an important role which cannot be ignored. Any changes from United States might affect the development trend of Host Cell Contaminant Testing.
