According to our (Global Info Research) latest study, the global Hot Core Process Core Shooter market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Hot core process core shooter is a kind of equipment used to manufacture core parts in castings. Cores are parts used in the casting process to form internal cavities or complex shapes, usually made of sand cores. Hot core process The core shooter adopts the hot core process, which is a process for preparing core sand using hot sand cores. Compared with the traditional cold core process, the hot core process has higher production efficiency and better core sand quality. The technological process of the hot core process core shooter is as follows: 1. Heating: heat the sand core box to a certain temperature, usually 200°C to 300°C. 2. Injection: Put the sand core box into the hot core process core shooter, and heat the core sand by spraying a special gas (usually ammonia). 3. Curing: while the core sand is heated, a special curing agent (usually dimethyl diisocyanate) is sprayed to trigger a chemical reaction, so that the core sand is quickly cured. 4. Demoulding: The cured core can be removed from the core box for the casting process. The hot core technology core shooter has the following advantages: 1. High production efficiency: The hot core technology core shooter can quickly heat and solidify the core sand to improve production efficiency. 2. High core sand quality: The hot core process can produce high-quality core sand with good high temperature resistance and stability. 3. Environmental protection: The hot core technology core shooter does not need to use organic solvents, which reduces the pollution to the environment. The hot core process core shooter is widely used in the casting production of automobile, machinery manufacturing, energy and other industries. It can produce high-quality core parts and improve the performance and reliability of products.
