Hot-End Coating (HEC) refers to a protective coating applied to glass surfaces immediately after the forming process, while the glass is still hot. The primary function of this coating is to enhance the glass's surface durability by increasing its resistance to scratches, abrasions, and mechanical damage during handling, transport, and further processing. Typically, metal oxides such as tin oxide (SnO₂) are used to create a thin, durable layer on the glass surface, which also improves the adhesion of subsequent cold-end coatings applied for additional protection or functionality.
