According to our (Global Info Research) latest study, the global Hot Evaporative Humidifier market size was valued at US\$ 3057 million in 2024 and is forecast to a readjusted size of USD 5251 million by 2031 with a CAGR of 8.1% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The working principle of a thermal evaporative humidifier is to heat water to 100 degrees in a heating body, evaporate it to produce steam, and then use a fan to send the steam out, thereby increasing the humidity of the air. This process is similar to the principle of converting electrical energy into thermal energy, the water temperature continues to rise, and when it reaches a certain level, water vapor is produced. A thermal evaporative humidifier is a type of humidifier, which can be further subdivided into electrode humidifiers, electric heating humidifiers, and dry steam humidifiers. These humidifiers may differ slightly in structure, but the core working principle is to use heat energy to evaporate water into water vapor and then release it into the air. Thermal evaporative humidifiers are generally suitable for places where humidity needs to be precisely controlled, such as laboratories, hospitals, libraries, etc. At the same time, because its humidification effect is stable and does not produce pollutants such as white powder, it is also suitable for families with high requirements for air quality.
