Abstracts

According to our (Global Info Research) latest study, the global HPP Cold-Pressed Juices market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Different from FC (concentrated reconstituted juice) and NFC (non-concentrated reconstituted juice), HPP cold-pressed fresh juice uses ultra-high pressure sterilization technology. The canned fresh juice is placed in a sealed container and sterilized with 400 to 600 MPa ultra-high pressure using water as a medium, thereby killing a large number of microorganisms in the juice. During the HPP high-pressure sterilization process, the temperature of the juice will not rise, avoiding the loss of a large amount of nutrition and taste of the juice. HPP technology has been applied in the production of juice due to its low-temperature sterilization characteristics. Juice sterilized by HPP high pressure is called HPP juice, also known as ultra-high pressure cold-pressed juice. Compared with juice treated with heat sterilization, juice treated with HPP ultra-high pressure can retain more than 95% of the vitamin C content. HPP technology can greatly extend the freshness of freshly squeezed juice. HPP is a non-thermal treatment process that does not require preservatives or additives.
