Abstracts

The global Hub Lathe market size is expected to reach \$ 1527 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

A hub lathe is a CNC or semi-automatic machine tool specifically designed for repairing and finishing automotive wheels (including steel and aluminum alloy wheels). In 2025, global Hub Lathe production reached approximately 17,533 units, with an average global market price of around 60 K US\$/Unit. The production capacity of Hub Lathe reaches 21,900 units, and the industry's gross profit margin is approximately between 25% and 45%.

Driving factors in the hub lathe market include the growth and upgrading of automotive production and remanufacturing, as OEMs, tier-1 suppliers and wheel/hub refurbishers need dedicated machines to turn, face and profile wheel hubs, brake discs and related components with high precision and repeatability. The push for vehicle safety, NVH optimization and tighter dimensional tolerances in both ICE and EV platforms drives demand for lathes that can ensure consistent runout, surface finish and concentricity. At the same time, expansion of the aftermarket for wheel repair and brake disc resurfacing?driven by higher vehicle parc, alloy wheel penetration and stricter inspection standards?supports smaller, flexible hub lathes suitable for workshops and service centers.

This report studies the global Hub Lathe production, demand, key manufacturers, and key regions.
