## Abstracts

The global Hull and Transom Anode market size is expected to reach \$ 699 million by 2032, rising at a market growth of 4.1% CAGR during the forecast period (2026-2032).

In 2025, global Hull and Transom Anode production reached approximately 9,400 k units with an average global market price of around US\$ 55 per unit, and a gross profit margin of approximately 20%-40%. Hull and Transom Anodes are sacrificial corrosion protection components installed on ship hulls and transoms to protect underwater metals from galvanic corrosion. They are commonly used on commercial vessels and boats, where the transom area is exposed to strong turbulence, mixed metals, and high corrosion risk near propulsion systems. Made from zinc, aluminum, or magnesium alloys, these anodes corrode preferentially, supplying protective current to the hull, transom fittings, and nearby hardware. Designs vary by shape, mounting method, alloy selection, and current output to match water salinity and service intervals. When combined with coatings, hull and transom anodes reduce pitting, extend asset life, and lower dry-dock maintenance frequency. The industrial chain of Hull and Transom Anodes includes upstream inputs such as zinc/aluminum/magnesium ingots, alloying elements, steel inserts, casting molds, fluxes, fasteners, and protective coatings. Midstream manufacturing covers alloy melting, casting, cooling, machining, drilling, insert bonding, marking, and electrochemical capacity testing. Downstream users include shipyards, boat builders, repair docks, marinas, vessel operators, and marine service contractors. Services include anode sizing design, installation, inspection, replacement scheduling, and recycling of spent anodes.

This report studies the global Hull and Transom Anode production, demand, key manufacturers, and key regions.
