## **Abstracts**

The global Human Body Temperature Measurement Module market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The main working principle of the human body temperature measurement module is to sense the thermal radiation of the human body in real time through infrared thermal imaging technology, and convert the thermal radiation into corresponding temperature values with the help of temperature measurement algorithms. It can quickly and accurately measure the body temperature of the human body without direct contact with the skin, avoiding the risk of cross-infection and breeding germs, and has a wide range of applications.

The human body temperature measurement module is a device that integrates infrared thermal imaging technology and temperature measurement algorithms for non-contact measurement of human body temperature. It usually consists of an infrared sensor, a digital signal processor and an output interface.

This report studies the global Human Body Temperature Measurement Module production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Human Body Temperature Measurement Module, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
