Abstracts

According to our (Global Info Research) latest study, the global Human Circulatory System Model market size was valued at US\$ 157 million in 2025 and is forecast to a readjusted size of US\$ 255 million by 2032 with a CAGR of 7.5% during review period.

In 2025, global Human Circulatory System Model production reached approximately 402,000 Units. The average price is approximately \$380. A Human Circulatory System Model is a three-dimensional educational and training model designed to visually and structurally represent the human cardiovascular system, including the heart, arteries, veins, capillaries, and pulmonary circulation. It is used to demonstrate how blood circulates through the body, how oxygen and nutrients are delivered to tissues, and how waste products are removed.

Gross Profit Margin Levels

Human circulatory system models generally exhibit characteristics of "high gross profit margin and strong distribution channels." Products are mostly injection-molded/resin-based, with manual painting and assembly. Material costs account for a relatively limited proportion, while mold amortization, R&D (anatomical accuracy/educational design), brand premium, channel distribution, and after-sales service constitute the main sources of value. Common industry gross profit margins can be divided into three tiers: First, standard teaching models (embossed panels/basic heart models) are mainly produced on a large scale, with gross profit margins typically between 30% and 45%. Second, detachable/pathological kits/university procurement kits, due to SKU combinations and added value from educational content, typically have gross profit margins between 40% and 55%. Third, digitally integrated (AR content/course

packages) or customized (small-batch 3D printing, hospital research/instrument demonstrations) have higher unit delivery value, resulting in gross profit margins of 50% to 65%. It is important to note that if OEM supply is the primary method or volume is achieved through low-priced e-commerce channels, gross profit margins will be significantly compressed; conversely, if products are included in university procurement catalogs and course/content services are provided, gross profit margins and repeat purchase stability are usually better.

Industry Drivers

The core of demand growth stems from the shift in medical education and clinical training from "understanding" to "repeatable practice and demonstrable competence." On one hand, the healthcare system emphasizes patient safety and reducing medical errors, driving increased investment in simulation training and standardized teaching. On the other hand, the widespread adoption of minimally invasive/interventional technologies has led to a continuous expansion of demand for training in cardiovascular anatomy and pathway understanding, as well as vascular access-related training. Simultaneously, VR/AR and interactive content are upgrading traditional models into "model + digital content" teaching solutions, improving classroom interaction and adaptability to remote learning (some products already incorporate AR as part of their learning tools).
