Abstracts

A combination vaccine is designed to provide protection against two or more diseases or against single disease caused by completely different or similar organism. A combination vaccine also boosts the immune system to fight against infection. These vaccines contain two or more antigens that are either combined in ready form or mixed before administration. Safety, efficacy, and immunogenicity of a combined immunizing agent are high.

Scope of the Report:

This report focuses on the Human Combination Vaccines in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. The increase in pediatric population is one of the primary growth factors for this market. With the increase in pediatric population, the demand for combination vaccines for immunization is higher as newborn infants are more vulnerable to various infectious diseases due to weak immune systems. These vaccines help reduce the number of shots and healthcare center visits, which consequently save time and money. It has been observed that the occurrence of viral infections and diseases such as polio, tetanus, diphtheria, smallpox, chickenpox, and measles is high among children in developing nations.

The Americas is expected to be the major revenue contributor to the market by 2023. The introduction of strict regulatory norms that recommend proper vaccination of infants and the continuous efforts by vendors and national organizations to promote the use of human combination vaccines, will drive the market's growth prospects in the Americas. The worldwide market for Human Combination Vaccines is expected to grow at a CAGR

of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
