Abstracts

Cystatin C (cysc) is the substance with the strongest inhibitory effect on cathepsin B found so far, and its biological function is mainly to regulate the activity of cysteine protease. Because of its small molecular weight, it can freely pass through the glomerular filtration membrane, and is almost completely reabsorbed by the glomerulus without being secreted. It can well replace creatinine and become a new ideal marker for reflecting GFR. It is an indicator with good sensitivity and high specificity for evaluating renal function. It not only has clinical value in kidney disease, but also has important reference value in the application of liver disease, diabetes, cardiovascular disease and tumor and other fields.
