Human immunoglobulin for intramuscular injection (IMIG), commonly known as 'IMIG', is an immunoglobulin preparation extracted and purified from healthy human plasma. It contains a variety of antibodies and is mainly used to enhance immunity. It is used by intramuscular injection and cannot be infused intravenously. Its functions include: 1. Prevention of infection: By providing antibodies against viruses (such as measles, hepatitis A, rubella, etc.) and bacteria, it helps prevent infections caused by these pathogens. 2. Replacement of xenogeneic blood products: Avoid the immune response caused by the use of animal blood products (such as horses, mice, etc.) to improve safety. 3. Treatment of immunodeficiency: Provide supplements for patients who cannot produce enough immunoglobulins on their own to help improve the function of the immune system.
