According to our (Global Info Research) latest study, the global Human Interleukin Residue Detection Kit market size was valued at US\$ 156 million in 2025 and is forecast to a readjusted size of US\$ 337 million by 2032 with a CAGR of 11.7% during review period.

Human Interleukin Residue Detection Kit is a bioanalytical reagent product used to detect the levels of residual human interleukins (such as IL-2, IL-6, and IL-15) during cell preparation. This kit is commonly used in the quality control and safety evaluation of cell therapy products, recombinant protein drugs, vaccines, and biological agents to ensure the effective removal of exogenous cytokines during the manufacturing process and avoid the risk of immune reactions. The detection principle is typically based on sandwich ELISA or chemiluminescent immunoassay, featuring high sensitivity, strong specificity, and good reproducibility. It can quantitatively determine the level of residual interleukins in samples, providing a scientific basis for release testing and process validation of biological products. In 2025, sales volume was 330,000 units, with an average price of US\$422, a single-line production capacity of 30,000 units, and a gross profit margin of 80%.
