The global Human Interleukin Residue Detection Kit market size is expected to reach \$ 337 million by 2032, rising at a market growth of 11.7% CAGR during the forecast period (2026-2032).

Human Interleukin Residue Detection Kit is a bioanalytical reagent product used to detect the levels of residual human interleukins (such as IL-2, IL-6, and IL-15) during cell preparation. This kit is commonly used in the quality control and safety evaluation of cell therapy products, recombinant protein drugs, vaccines, and biological agents to ensure the effective removal of exogenous cytokines during the manufacturing process and avoid the risk of immune reactions. The detection principle is typically based on sandwich ELISA or chemiluminescent immunoassay, featuring high sensitivity, strong specificity, and good reproducibility. It can quantitatively determine the level of residual interleukins in samples, providing a scientific basis for release testing and process validation of biological products. In 2025, sales volume was 330,000 units, with an average price of US\$422, a single-line production capacity of 30,000 units, and a gross profit margin of 80%.

This report studies the global Human Interleukin Residue Detection Kit production, demand, key manufacturers, and key regions.
