According to our (Global Info Research) latest study, the global Human Recombinant SCF market size was valued at US\$ 60.7 million in 2024 and is forecast to a readjusted size of USD 109 million by 2031 with a CAGR of 8.4% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Human recombinant stem cell factor (SCF) is a glycoprotein that is produced through recombinant DNA technology. It is designed to mimic the natural stem cell factor, which plays a crucial role in the body. Natural SCF is a cytokine that binds to its receptor, c-Kit, present on the surface of various cell types, including hematopoietic stem cells, mast cells, and melanocytes. Human recombinant SCF is manufactured by inserting the gene encoding SCF into host cells, such as bacteria or mammalian cells, which then produce the protein. This recombinant form has similar biological functions to the native SCF. It promotes cell survival, proliferation, and differentiation of stem cells and other cell populations. In the context of medical research and applications, human recombinant SCF can be used in areas such as hematopoietic stem cell transplantation, where it helps in mobilizing and expanding hematopoietic stem cells. It also has potential in treating certain blood disorders and in tissue engineering, as it can stimulate the growth and development of relevant cell types, and contribute to the regeneration and repair of tissues. Overall, human recombinant SCF provides a consistent and controllable source of the cytokine for both research and therapeutic purposes, enabling scientists and medical professionals to study and manipulate cell behavior more effectively.
