## Abstracts

Hump speed radar is a speed detector that works in the millimeter wave band. It uses the Doppler effect of moving targets on millimeter waves to extract speed information. This kind of equipment is mainly used to measure the discharge speed of vehicles in railway marshalling yards, and is suitable for continuous work under all-weather conditions. It can provide vehicle slip speed information to semi-automatic or automatic speed control systems, thereby improving the efficiency of hump operations and the safety of construction pit stops. Hump shunting is a shunting method that uses the gravity of the train to slide vehicles. Through the use of hump speed radar, the marshalling station operations can be automated, improve efficiency, ensure operating safety, and improve working conditions.
