The global HVAC On-Demand Services market size is expected to reach \$ 151 million by 2032, rising at a market growth of 5.5% CAGR during the forecast period (2026-2032).

HVAC on-demand service refer demand-based service model that allows users to control and manage their heating, ventilation and air conditioning (HVAC) systems according to actual needs. HVAC On-Demand Services is an intelligent HVAC operation and maintenance management model based on IoT, big data, and cloud computing technologies. This model deploys sensors and intelligent controllers at the equipment level to collect real-time operational data such as temperature, pressure, and energy consumption, uploading this data to a cloud platform for analysis and prediction. The system abandons traditional scheduled inspections and passive maintenance, instead dynamically triggering maintenance reminders, fault warnings, or energy efficiency optimization commands based on the actual operating status of the equipment, usage time, and environmental changes. Its core lies in shifting from 'fixed-cycle maintenance' to 'precise on-demand service,' effectively extending equipment lifespan, reducing energy consumption, providing users with a stable and comfortable indoor environment, and significantly improving operation and maintenance efficiency.

The HVAC On-Demand Services market is rapidly transforming from traditional passive maintenance to data-driven proactive services. Technologically, the Internet of Things (IoT) enables comprehensive equipment status awareness through temperature, humidity, vibration, and energy consumption sensors; edge computing performs local data preprocessing and rapid diagnostics; cloud platforms aggregate massive amounts of data for machine learning modeling, enabling fault prediction and energy efficiency optimization; and digital twin technology supports equipment-level 3D visualization of

operations and maintenance. In terms of development trends, the industry is evolving from single-device monitoring to 'system-level on-demand services,' emphasizing the coordinated optimization of cooling and heating sources, distribution systems, and end-point ventilation and water systems, and beginning to explore new business models based on 'payment based on comfort or energy performance.' Key drivers of this development include mandatory policy requirements for building energy conservation and carbon reduction, the urgent need of commercial building owners to reduce maintenance labor costs and extend equipment lifespan, and the improved cost-effectiveness of solutions brought about by the maturity of IoT and cloud technologies. However, its development still faces obstacles: a large number of old devices in the existing market lack digital interfaces, making transformation difficult and costly; different brands of equipment do not have open protocols, creating barriers to data collection and interconnection; users have concerns about data security and privacy; in addition, the shift from selling equipment to selling services also poses challenges to the organizational capabilities of service providers.
