Abstracts

According to our (Global Info Research) latest study, the global HVDC BBU market size was valued at US\$ 3.29 million in 2025 and is forecast to a readjusted size of US\$ 867 million by 2032 with a CAGR of 89.8% during review period.

HVDC BBU is a high-voltage direct-current battery backup unit designed for high-power data centers, especially AI data centers. It is typically connected to a 400V DC or 800V DC high-voltage DC bus and integrates battery strings, BMS, high-voltage protection, DC/DC power conversion, thermal management, and control/communication systems. In the event of a main power abnormality or transient load fluctuation, it provides short-duration backup power, ride-through capability, DC bus voltage support, and power buffering for rack-level, row-level, or local cluster-level loads.

Currently, global data centers predominantly utilize UPS architectures, while DC power architectures account for a relatively small share; as a core component of DC power architectures, the BBU is also in the early stages of development and has not yet seen large-scale adoption. Driven by the growing demand for computing power, High-Voltage Direct Current (HVDC) power architecture has emerged as the mainstream solution for the future construction of hyperscale data centers and AI computing centers. The BBU is a critical hardware component within the HVDC power system, essential for providing energy storage and backup power to ensure the uninterrupted operation of computing centers.
