Abstracts

The global HVDC BBU market size is expected to reach \$ 867 million by 2032, rising at a market growth of 89.8% CAGR during the forecast period (2026-2032).

HVDC BBU is a high-voltage direct-current battery backup unit designed for high-power data centers, especially AI data centers. It is typically connected to a 400V DC or 800V DC high-voltage DC bus and integrates battery strings, BMS, high-voltage protection, DC/DC power conversion, thermal management, and control/communication systems. In the event of a main power abnormality or transient load fluctuation, it provides short-duration backup power, ride-through capability, DC bus voltage support, and power buffering for rack-level, row-level, or local cluster-level loads.

Currently, global data centers predominantly utilize UPS architectures, while DC power architectures account for a relatively small share; as a core component of DC power architectures, the BBU is also in the early stages of development and has not yet seen large-scale adoption. Driven by the growing demand for computing power, High-Voltage Direct Current (HVDC) power architecture has emerged as the mainstream solution for the future construction of hyperscale data centers and AI computing centers. The BBU is a critical hardware component within the HVDC power system, essential for providing energy storage and backup power to ensure the uninterrupted operation of computing centers.

This report studies the global HVDC BBU production, demand, key manufacturers, and key regions.
