Abstracts

According to our (Global Info Research) latest study, the global HVO-100 market size was valued at US\$ 26.75 million in 2025 and is forecast to a readjusted size of US\$ 84.27 million by 2032 with a CAGR of 17.6% during review period.

In 2025, the global production of HVO-100 reached approximately 24,000 tons, with an average global market price of around US\$1,100 per ton. In the same year, the global total production capacity of HVO-100 reached 30,000 tons. The industry average gross profit margin of this product reached 20%-40%. HVO-100 (Hydrotreated Vegetable Oil 100%) is a 100% renewable diesel fuel made by hydrotreating vegetable oil, animal fat or waste oil. Its chemical structure is similar to fossil diesel and can be used directly in conventional diesel engines without modification. It has a higher cetane number (70-90), lower sulfur content, better low-temperature performance and reduces greenhouse gas emissions by up to 90%. HVO-100 complies with EN 15940 standards and is suitable for transportation, shipping and other fields. It is a high-end product among biofuels.

The HVO-100 industry chain begins upstream with the supply of biomass feedstocks, including used cooking oil (UCO), animal fats, palm oil, and other vegetable oil resources. The midstream comprises the core production phase, where bio-oils are converted into high-purity paraffinic diesel using hydrotreating and isomerization technologies; this segment is dominated by refining companies such as Neste and Chevron Renewable Energy Group. The downstream sector consists of end-use markets, including road transport, off-road machinery, marine fuel, and certain sustainable aviation fuel applications. The entire industry chain relies heavily on the stability of feedstock supplies and policy incentives, exhibiting a structure defined by feedstock constraints, policy drivers, and capital-intensive refining operations.

Future growth for HVO-100 is primarily driven by global carbon neutrality policies, the demand for alternative transport fuels, and decarbonization efforts in the aviation and shipping sectors. As a "drop-in" fuel solution, it addresses a persistent, long-term demand in heavy-duty transport sectors that are difficult to electrify. While demand is expected to expand alongside the implementation of the EU's RED III, the US Low Carbon Fuel Standard (LCFS), and stricter global shipping emission regulations, growth remains constrained by bottlenecks in feedstock supply (such as waste oils) and high production costs. In the long term, HVO-100 will form part of a multi-pathway decarbonization energy system alongside electrification and hydrogen; it is projected to maintain rapid growth through 2030, though it may subsequently enter a phase characterized by feedstock constraints and price competition.
