## Abstracts

According to our (Global Info Research) latest study, the global Hyaluronan (Protein) market size was valued at USD 514.5 million in 2023 and is forecast to a readjusted size of USD 975.5 million by 2030 with a CAGR of 9.6% during review period.

Hyaluronic acid also called hyaluronan, is an anionic, nonsulfated glycosaminoglycan distributed widely throughout connective, epithelial, and neural tissues. It is unique among glycosaminoglycans in that it is nonsulfated, forms in the plasma membrane instead of the Golgi apparatus, and can be very large: human synovial HA averages about 7 million Da per molecule, or about 20000 disaccharide monomers, while other sources mention 3–4 million Da. As one of the chief components of the extracellular matrix, hyaluronan contributes significantly to cell proliferation and migration, and may also be involved in the progression of some malignant tumors.
