Abstracts

According to our (Global Info Research) latest study, the global Hybrid Brain–Computer Interface (hBCI) market size was valued at US$ 498 million in 2025 and is forecast to a readjusted size of US$ 702 million by 2032 with a CAGR of 5.1% during review period.

A typical hybrid BCI is also composed of one BCI and another system (which might be another BCI), and must also achieve specific goals better than a conventional system. For example, a hybrid BCI might infer user intent more accurately during imagery-based and/or visual attention-based experimental paradigms, improve the overall performance of the system, or reduce the rate of false positives during resting periods of i.e. steady-state visual evoked potential (SSVEP)-based BCI applications.
