Abstracts

The term "hybrid ceramic ball bearing" normally refers to a bearing assembly consisting of inner and outer rings of steel, with silicon nitride (Si₃N₄), Zirconium Dioxide (ZrO₂), Silicon Carbide (SiC), etc. ceramic balls. For some applications, the properties of the bearing with ceramic balls offer functional improvements in several different areas over a conventional all-steel bearing. There is a very significant cost penalty for the hybrid ceramic design that largely limits its present-day use to certain high-end applications. However, this cost gap is expected to shrink over time with advances in ceramic ball manufacturing technology.
