Abstracts

According to our (Global Info Research) latest study, the global Hybrid Servo System market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Hybrid servo motor is a new type of motor that combines stepper motor and servo motor. Its structure is different from ordinary servo motors. The rotor of a hybrid servo motor is composed of multipole magnets and iron cores, while a regular servo motor is composed of a rotor and stator. The working principle of hybrid servo motors is also different from that of ordinary servo motors. Hybrid servo motors achieve rotor positioning by controlling current, while ordinary servo motors achieve rotor positioning by controlling torque. There are also some differences in the scope of application between hybrid servo motors and ordinary servo motors. Hybrid servo motors are suitable for applications that require high precision and high speed, such as machine tools, printing machines, etc. Ordinary servo motors are suitable for applications that require high precision and low speed, such as robots, automated production lines, etc. Hybrid servo drives can overcome the problem of step loss in open-loop stepper motors, while also significantly improving the high-speed performance of the motor, reducing its heat generation and vibration, thereby improving the machining speed and accuracy of the machine and reducing its energy consumption.
