Abstracts

According to our (Global Info Research) latest study, the global Hybrid Woven Fiber Fabric market size was valued at US\$ 835 million in 2025 and is forecast to a readjusted size of US\$ 1319 million by 2032 with a CAGR of 6.6% during review period.

Hybrid Woven Fiber Fabric is a woven reinforcement fabric made by interlacing two or more different fiber yarns in the warp and weft directions, typically combining carbon fiber, glass fiber, aramid fiber, basalt fiber, flax fiber, UHMWPE fiber, ceramic fiber or metallic yarns in one woven structure. Its purpose is to integrate the advantages of different fibers in a single fabric, such as combining the stiffness and compressive strength of carbon fiber with the impact resistance and wear resistance of aramid fiber, or combining the mechanical performance of carbon fiber with the cost efficiency and insulation properties of glass fiber. Compared with single-fiber woven fabrics, hybrid woven fiber fabric provides more flexible performance design in stiffness, toughness, vibration damping, weight, cost, electrical conductivity, insulation and thermal resistance. However, its final performance is strongly affected by fiber combination, yarn ratio, weave pattern, surface treatment and resin compatibility.

In 2025, global sales of Hybrid Woven Fiber Fabric reached approximately 34 K tons, with an average global market price of around US\$ 24/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 20% to 40%.
