Abstracts

According to our (Global Info Research) latest study, the global Hydraulic Balanced Electric Roller Press Machine market size was valued at US\$ 37.51 million in 2025 and is forecast to a readjusted size of US\$ 56.67 million by 2032 with a CAGR of 6.1% during review period.

In 2025, global sales volume of hydraulic balanced electric roller press machine was approximately 1,350 units, with a mainstream ex-factory price of around USD 27,000 per unit. The gross margin of major manufacturers in the industry was approximately 28%?42%.

A hydraulic balanced electric roller press machine is a two-roll calendering device used for the compaction and calendering of thin-sheet materials such as battery electrodes and functional material sheets. It is generally composed of upper and lower high-hardness rollers, an electric drive system, a hydraulic pressurizing system, a roll gap adjustment mechanism, a transmission system, and a safety control system. Compared with ordinary electric roller presses, its core feature is that it uses a hydraulic system to provide stable rolling pressure, while the hydraulic balancing structure improves the force consistency on both sides. This enables the sheet material to achieve more uniform thickness, more stable compaction performance, and better surface flatness during rolling. The equipment is commonly used in small-scale and pilot-scale preparation of electrodes for lithium-ion batteries, sodium-ion batteries, solid-state batteries, and supercapacitors, and can also be used for calendering conductive films, composite films, and experimental sheet materials.

The upstream supply chain of hydraulic balanced electric roller press machine mainly

includes high-hardness alloy steel rollers, stainless steel frames, hydraulic pump stations, cylinders, servo or variable-frequency motors, reducers, bearings, sensors, electrical control components, and heating temperature-control components. Among them, roller precision, hydraulic system stability, and control system performance directly affect the consistency of the calendaring process. Downstream demand mainly comes from battery material research institutions, battery company pilot lines, electrode preparation laboratories, and functional material development companies. Core demand is concentrated on improving electrode compaction density, controlling thickness consistency, validating material processes, and preparing small-batch samples. With the continuous iteration of battery material systems and the expansion of laboratory and pilot-line construction, demand for this type of equipment is expected to continue upgrading toward higher precision, automation, heating capability, and combined pressure-roll gap control.
