## Abstracts

According to our (Global Info Research) latest study, the global Hydraulic Bursting Testing Machine market size was valued at US\$ 57.9 million in 2024 and is forecast to a readjusted size of USD 144 million by 2031 with a CAGR of 14.0% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The hydraulic bursting tester is used to measure the bursting strength of textile materials under increasing hydrostatic pressure. This pressure is applied to a circular area of ??the sample via an elastic diaphragm. A pneumatic clamping device clamps the sample firmly at the edge of this circular area. When pressure is applied, the sample deforms together with the diaphragm. The bursting strength corresponds to the maximum pressure to which the sample is subjected before rupture. Based on the same principle as the multi-directional tensile test (ball bursting method for textiles), this measurement is independent of the cutting direction of the sample (machine or transverse direction), because rupture naturally occurs in the direction of least resistance.

With the continuous advancement of testing technology, the testing accuracy of hydraulic bursting testers will continue to improve. This helps to more accurately evaluate the pressure resistance and bursting strength of the tested products, thereby ensuring the safety and reliability of the products. In order to meet the testing needs of different industries, hydraulic bursting testers will gradually develop in the direction of multi-functions. For example, by adding different test modules and accessories, the

integration and switching of multiple test functions can be achieved. With the continuous improvement of environmental awareness, hydraulic bursting testers will also pay more attention to environmental protection and energy saving. For example, using more environmentally friendly test media, optimizing equipment structure to reduce energy consumption, etc.
