According to our (Global Info Research) latest study, the global Hydraulic Diaphragm Accumulator market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Hydraulic Diaphragm Accumulator is a hydraulic component used to store liquid energy in a hydraulic system and release it when needed.

A hydraulic diaphragm accumulator consists of two main parts: a liquid chamber and a gas chamber, separated by a flexible diaphragm. The liquid chamber is used to store hydraulic oil, while the gas chamber is filled with compressed gas (usually nitrogen). When the hydraulic oil in the hydraulic system is pushed into the liquid chamber, the diaphragm will deform due to the entry of liquid, causing the gas to be compressed. In this way, the energy of the liquid is stored in the accumulator in the form of compressed gas.

Currently, the typical models of Hydraulic Diaphragm Accumulator include Parker Hannifin's AD Series, etc.
