## Abstracts

Hydraulic pumps are used in hydraulic drive systems and can be hydrostatic or hydrodynamic. A hydraulic pump is a mechanical source of power that converts mechanical power into hydraulic energy (hydrostatic energy i.e. flow, pressure). It generates flow with enough power to overcome pressure induced by the load at the pump outlet. When a hydraulic pump operates, creates a vacuum at the pump inlet, which forces liquid from the reservoir into the inlet line to the pump and by mechanical action delivers this liquid to the pump outlet and forces it into the hydraulic system.

According to our (Global Info Research) latest study, the global Hydraulic Pumps market size was valued at US\$ 9931 million in 2023 and is forecast to a readjusted size of USD 13640 million by 2030 with a CAGR of 4.7% during review period.
