Abstracts

The global Hydrocarbon Recovery Unit market size is expected to reach \$ 242 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

A hydrocarbon recovery unit is a device specially designed to separate and remove hydrocarbons (such as oil, diesel, gasoline, lubricants, etc.) from water. It uses the density difference between hydrocarbons and water, combined with gravity sedimentation, coalescence separation or adsorption technology to separate oil pollutants and prevent them from entering sewers or natural water bodies, thereby reducing the risk of environmental pollution. This equipment is usually equipped with multiple compartments, filter units or adsorption media to improve separation efficiency. Hydrocarbon recovery units are widely used in places such as oil refineries, gas stations, industrial emission treatment facilities, and airports. They are particularly suitable for the treatment of oily wastewater and rainwater runoff to ensure that the discharged water quality meets environmental regulations. In 2025, global Hydrocarbon Recovery Unit production reached approximately 18620 units, with an average global market price of around 8000 USD/unit. The production capacity for Hydrocarbon Recovery Unit in 2025 was approximately 20000 units. The typical gross profit margin for Hydrocarbon Recovery Unit between 20% and 40%.

The Hydrocarbon Recovery Unit market is driven by increasing environmental regulations, the need to reduce flaring and emissions, and the economic benefits of recovering valuable hydrocarbons. Growth in upstream oil & gas production, expansion of petrochemical industries, and rising demand for natural gas processing are key factors supporting market expansion. Technological advancements in separation efficiency and energy optimization are further enhancing the competitiveness of HRU

solutions, while fluctuations in oil and gas prices remain a major influencing factor.
