A hydrocarbon separating tank is a device specially designed to separate and remove hydrocarbons (such as oil, diesel, gasoline, lubricants, etc.) from water. It uses the density difference between hydrocarbons and water, combined with gravity sedimentation, coalescence separation or adsorption technology to separate oil pollutants and prevent them from entering sewers or natural water bodies, thereby reducing the risk of environmental pollution. This equipment is usually equipped with multiple compartments, filter units or adsorption media to improve separation efficiency. Hydrocarbon separating tanks are widely used in places such as oil refineries, gas stations, industrial emission treatment facilities, and airports. They are particularly suitable for the treatment of oily wastewater and rainwater runoff to ensure that the discharged water quality meets environmental regulations.
