Abstracts

The global Hydrocarbon Separation Unit market size is expected to reach \$ 2130 million by 2032, rising at a market growth of 4.6% CAGR during the forecast period (2026-2032).

A hydrocarbon separation unit is a device specially designed to separate and remove hydrocarbons (such as oil, diesel, gasoline, lubricants, etc.) from water. It uses the density difference between hydrocarbons and water, combined with gravity sedimentation, coalescence separation or adsorption technology to separate oil pollutants and prevent them from entering sewers or natural water bodies, thereby reducing the risk of environmental pollution. This equipment is usually equipped with multiple compartments, filter units or adsorption media to improve separation efficiency. Hydrocarbon separation units are widely used in places such as oil refineries, gas stations, industrial emission treatment facilities, and airports. They are particularly suitable for the treatment of oily wastewater and rainwater runoff to ensure that the discharged water quality meets environmental regulations. In 2025, global Hydrocarbon Separation Unit production reached approximately 18620 units, with an average global market price of around 8000 USD/unit. The production capacity for Hydrocarbon Separation Unit in 2025 was approximately 20000 units. The typical gross profit margin for Hydrocarbon Separation Unit between 20% and 40%.

The Hydrocarbon Separation Unit market is driven by increasing global demand for energy, natural gas processing, and petrochemical products. Expansion in LNG infrastructure, shale gas development, and refining capacity upgrades are key growth factors. Technological advancements in cryogenic and membrane separation are improving efficiency and reducing energy consumption. However, the market is influenced by oil and gas price volatility and capital expenditure cycles. Major players

focus on process optimization, modular design, and integration with carbon capture technologies.
