According to our (Global Info Research) latest study, the global Hydrodynamic Plain Bearings market size was valued at US\$ 1507 million in 2025 and is forecast to a readjusted size of US\$ 2312 million by 2032 with a CAGR of 6.1% during review period.

Hydrodynamic plain bearings are a type of sliding bearing that rely on the relative rotational motion between the shaft and the bearing surface to draw in lubricant. They form a continuous, wedge-shaped fluid film under operating load, which separates the two contact surfaces completely. This fluid film bears external loads, reduces friction and wear, and achieves stable, low-friction operation without additional external lubrication pressure. In 2025, the production volume of hydrodynamic plain bearings reached 721.21 thousand units, with market revenue hitting 1,465.21 million USD and an average selling price of 2,032 US dollars per unit. Driven by expanding production capacity and growing market demand, the industry maintains steady revenue growth. Meanwhile, intensified market competition and continuous manufacturing cost optimization lead to a gradual decline in average unit price, and the expanding output effectively offsets the downward pressure of product prices to sustain overall market expansion.
