The global Hydrodynamic Plain Bearings market size is expected to reach \$ 2312 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032).

Hydrodynamic plain bearings are a type of sliding bearing that rely on the relative rotational motion between the shaft and the bearing surface to draw in lubricant. They form a continuous, wedge-shaped fluid film under operating load, which separates the two contact surfaces completely. This fluid film bears external loads, reduces friction and wear, and achieves stable, low-friction operation without additional external lubrication pressure. In 2025, the production volume of hydrodynamic plain bearings reached 721.21 thousand units, with market revenue hitting 1,465.21 million USD and an average selling price of 2,032 US dollars per unit. Driven by expanding production capacity and growing market demand, the industry maintains steady revenue growth. Meanwhile, intensified market competition and continuous manufacturing cost optimization lead to a gradual decline in average unit price, and the expanding output effectively offsets the downward pressure of product prices to sustain overall market expansion.

This report studies the global Hydrodynamic Plain Bearings production, demand, key manufacturers, and key regions.
