According to our (Global Info Research) latest study, the global Hydrogen Inhalation Device market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Hydrogen inhalation devices enable users to inhale hydrogen gas through the nose, increasing hydrogen intake into the body. These devices come in two varieties: ones that emit only hydrogen gas and others that emit both hydrogen and oxygen gas.

Hydrogen inhalation devices are utilized in hydrogen inhalation therapy, an advanced medical technology. This therapy aims to improve the neurological condition of patients with post-cardiac arrest syndrome. It targets patients who have regained their own heartbeat after an out-of-hospital cardiac arrest, specifically those presumed to have experienced a cardiogenic cardiac arrest.

In the intensive care unit, eligible comatose patients, post-resumption of heartbeat, inhale 2% hydrogenated oxygen for 18 hours using a ventilator. This treatment follows intensive care guidelines. The inhalation of hydrogen gas is anticipated to protect brain cells and life, aiding patients' return to society, a significant medical goal.
