Abstracts

According to our (Global Info Research) latest study, the global Hydrogen-oxygen Gas Welding and Cutting Machine market size was valued at US\$ 289 million in 2025 and is forecast to a readjusted size of US\$ 424 million by 2032 with a CAGR of 5.6% during review period.

In 2025, the global production of Hydrogen-oxygen Gas Welding and Cutting Machine reached 20,000 units, with an average price of approximately US\$14,000 per unit. An Hydrogen-oxygen Gas Welding and Cutting Machine is an industrial heating device that uses water as a raw material to produce a mixture of hydrogen and oxygen on-site through electrolysis, and uses this mixture as a high-temperature flame heat source. It is also commonly referred to as an oxyhydrogen generator, oxyhydrogen welder, or water welder. Its basic principle is to use an electrolytic cell to decompose water into hydrogen and oxygen. After gas-liquid separation, pressure stabilization, backfire prevention, and flame control systems, a stable HH flame is formed through a specialized welding torch. This flame is used in metal brazing, precision welding, glass sealing, acrylic polishing, jewelry processing, welding of electronic and electrical components, localized heating, and repair applications. Compared to traditional oxyacetylene, liquefied petroleum gas (LPG), or natural gas flame equipment, industrial HH flame machines are characterized by on-site gas production, no need to store high-pressure gas cylinders, concentrated flame, and combustion products that are mainly water vapor, resulting in less pollution. They are suitable for industrial processing processes that require high safety, cleanliness, precise flame control, and localized high-temperature heating.
