According to our (Global Info Research) latest study, the global Hydrophilic Aluminum Foil for Air Conditioner Radiator market size was valued at US\$ 5058 million in 2025 and is forecast to a readjusted size of US\$ 6986 million by 2032 with a CAGR of 4.7% during review period.

Hydrophilic aluminum foil for air conditioner radiator refers to a functional coating with hydrophilic properties formed on the surface of the aluminum foil substrate through chemical coating, which enables condensed water to quickly spread and flow evenly on the surface of the fins instead of forming water droplets, thereby reducing air flow resistance, reducing condensation noise, and improving heat exchange efficiency. Its substrate is usually made of aluminum alloys such as 1100, 1200, 3102, 8011, etc., with a thickness generally ranging from 0.08 millimeters to 0.15 millimeters. The surface coating is mostly a composite structure of organic resin and inorganic corrosion-resistant system, which also has anti-corrosion, anti mold and certain antibacterial properties. It is the mainstream material for fins of modern household air conditioners, commercial air conditioners and heat pump evaporators. In 2025, global Hydrophilic Aluminum Foil for Air Conditioner Radiator production reached approximately 1,626 K MT, with an average global market price of around US\$ 3,023 per MT. The annual production capacity of hydrophilic aluminum foil for air conditioner radiator is 2,500 K MT, with a gross profit margin of about 15%.

The upstream mainly consists of suppliers of electrolytic aluminum, aluminum ingots, recycled aluminum, and a small amount of coating chemical materials, among which the cost of aluminum ingots directly determines the industry's profit fluctuations; The midstream includes aluminum foil rolling, annealing, surface coating, and slitting

processing enterprises; Downstream, the focus is on manufacturers of household air conditioners, commercial air conditioners, heat pumps, refrigeration equipment, and automotive air conditioning heat exchangers, with core customers including air conditioning host factories and heat exchanger assembly factories. In the cost structure, aluminum substrate costs account for the highest proportion, usually reaching 70% to 80%, coating materials account for about 5% to 10%, energy and manufacturing processing costs account for about 8% to 12%, and labor, packaging, and logistics costs account for about 5% to 8%.

Hydrophilic aluminum foil for air conditioner radiator has become the dominant product in global air conditioning heat exchange materials, accounting for nearly 80% of the total demand for heat sink aluminum foil, and continues to increase with the rapid popularization of high-efficiency air conditioning and heat pump equipment. The core of its market growth comes from the upgrading of energy-saving regulations, the increase in penetration rate of variable frequency air conditioners, and the expansion of overseas heat pump demand. High end products are gradually upgrading towards ultra-thin, high corrosion resistance, and antibacterial directions. In the industry competition, Chinese companies occupy the main global supply share with their advantages in aluminum substrate scale and cost, while Japanese and some European companies still have technological advantages in high-end coating stability and durability. Overall, this market belongs to the typical 'high value-added sub segment of home appliance basic materials', with demand highly correlated with global air conditioning and heat pump production. In the future, high-performance hydrophilic aluminum foil will still be the main source of industry profit growth.
