Abstracts

The global Hydrophilic Carbon Paper market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Hydrophilic carbon paper is a carbon material with good hydrophilicity, mainly made by processing carbon fiber and polymer composite materials. The surface of hydrophilic carbon paper has a certain degree of hydrophilicity, which can adsorb water molecules. Therefore, hydrophilic carbon paper has a wide range of applications in some special fields. There are two main methods for preparing hydrophilic carbon paper: 1 Chemical method: By coating hydrophilic substances such as polyvinyl alcohol on the surface of carbon materials, the surface has good hydrophilicity. 2. Physical method: By changing the microstructure and surface morphology of carbon materials, such as increasing surface roughness and changing surface oxygen content, their hydrophilicity can be improved. Hydrophilic carbon paper is widely used in fields such as biomedicine, environmental monitoring, and energy storage. For example, hydrophilic carbon paper can be used as electrode materials in biosensors, filter materials in water treatment, and electrode materials in lithium-ion batteries.
