Abstracts

According to our (Global Info Research) latest study, the global Hydropower market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Hydropower is the most mature, reliable and cost-effective renewable power generation technology where power is derived from the energy of water moving from higher to lower elevations. It is a proven, anticipated, and typically price-competitive technology. Hydropower has one of the best efficiencies of conversion of all known energy sources (water to wire 90 percent efficiency).

Hydropower installations have been registering steady growth, majorly driven by the demand for reliable, clean, and affordable power, as countries seek options to meet the carbon reduction goals set out in the Paris Agreement. Electricity generation, especially from conventional coal and petroleum-based power plants, has been identified as a significant source of greenhouse gas emission. Electricity, however, is a resource that people cannot live without, and its demand is only increasing, with growing industrialization and urbanization. This has forced governments of various countries to focus on renewable energy sources (such as wind, solar, hydro, nuclear, geothermal, etc.), which have the capability of generating clean electricity.

The Global Info Research report includes an overview of the development of the Hydropower industry chain, the market status of Industrial (Large Hydropower, Small Hydropower), Residential (Large Hydropower, Small Hydropower), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Hydropower.
